
Digital Logic and System Design

4. Gate-level Minimisation

COL215, I Semester 2024-2025
Venue: LH 408
'E' Slot: Tue, Wed, Fri 10:00-11:00

Instructor: Preeti Ranjan Panda
panda@cse.iitd.ac.in
www.cse.iitd.ac.in/~panda/
Dept. of Computer Science & Engg., IIT Delhi

Optimising a Gate-level Implementation

- Improving a gate-level design
- Objective?
  - Area
  - Delay
  - Power/Energy
  - Temperature
  - Testability/Reliability/Security/...
- Smaller is better
  - Always?

Literal Count

- Optimal circuit: **minimum number of literals**
- Focus on **Area**
  - **#literals** proportional to **#transistors**
- Simplification in using Literals:
  - Ignoring complement operations
  - Ignoring wires
  - Ignoring blank spaces
  - Ignoring transistor dimensions

Circular Design Flow

- Literal Count useful in spite of limitations
  - Fast decisions
  - Don’t need to generate full gate-level circuit, physical layout
- Gate-level decision
  - depends on geometry
  - ...which depends on gate-level decision 
- **Fast estimates** are critical!

Logic minimisation

- Optimization by applying Boolean Algebra theorems
  - Problem: in what order?
- **Map** method (**Karnaugh Map** or **K-Map**)
  - Pictorial representation of Truth Table
  - **2^n squares/cells** for n-variable function
    - one square for each input combination (truth table row)
    - value = 1 if corresponding minterm included in function
    - otherwise, value = 0

a	b	c	F
0	0	0	0
0	0	1	1
0	1	0	0
0	1	1	1
1	0	0	1
1	0	1	0
1	1	0	1
1	1	1	0

Truth Table

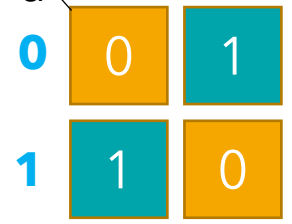
0	1	1	0
1	0	0	1

Map of function F

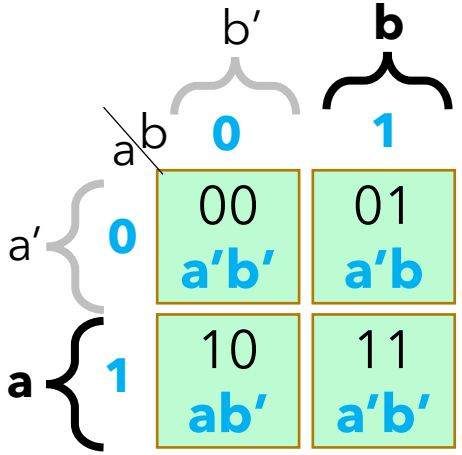
2-variable Karnaugh Map

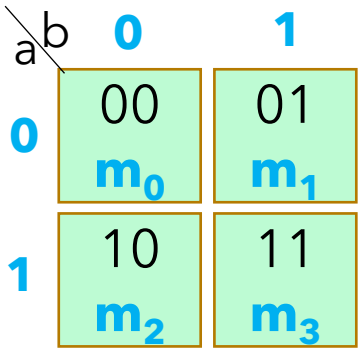
a	b	F
0	0	0
0	1	1
1	0	1
0	1	0

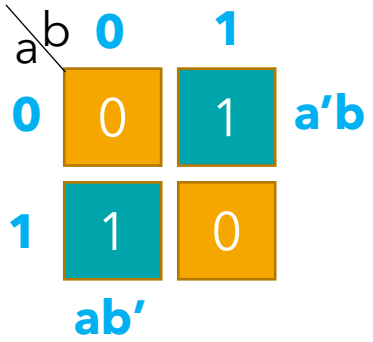
Truth Table



Karnaugh Map of F





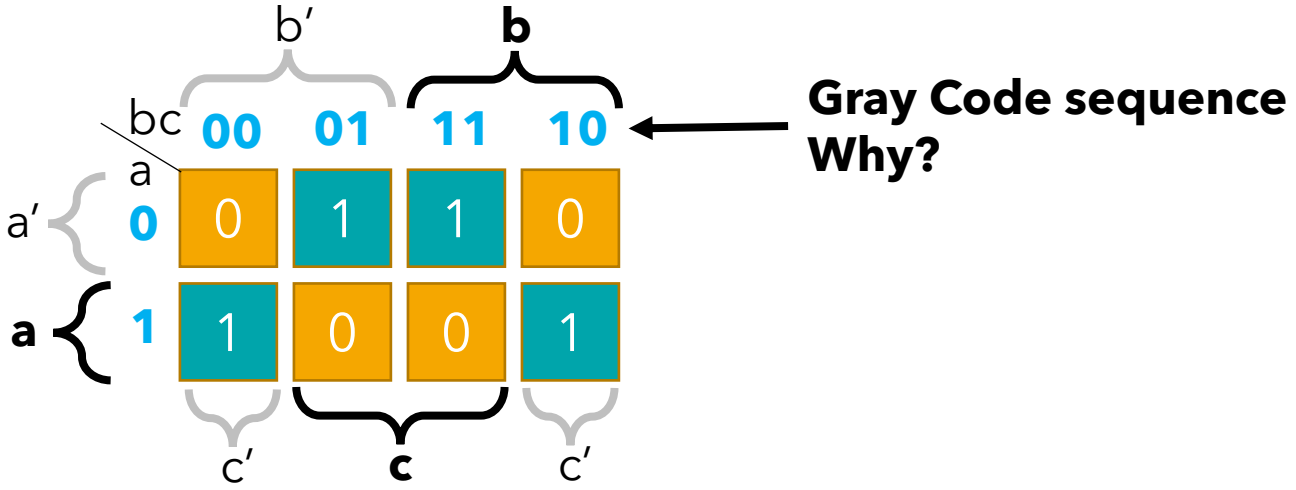


F = a′b + ab′

3-variable Karnaugh Map

a	b	c	F
0	0	0	0
0	0	1	1
0	1	0	0
0	1	1	1
1	0	0	1
1	0	1	0
1	1	0	1
1	1	1	0

Truth Table

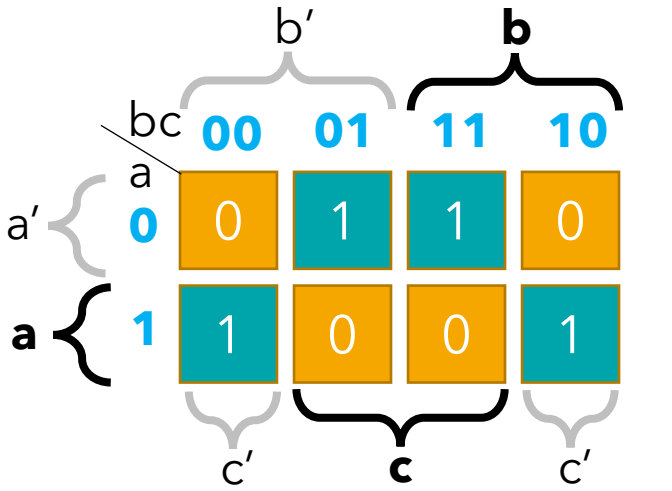


F = a'b'c + a'bc + ab'c' + abc'

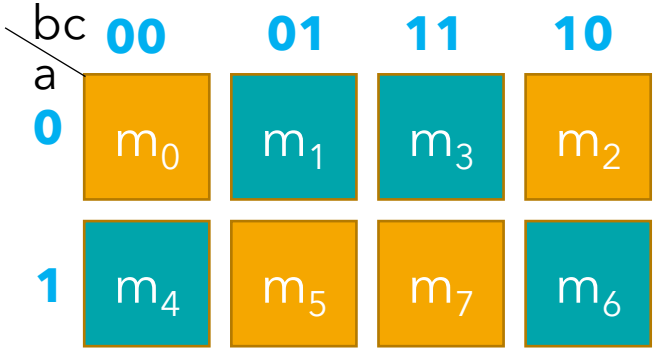
3-variable Karnaugh Map

a	b	c	F
0	0	0	0
0	0	1	1
0	1	0	0
0	1	1	1
1	0	0	1
1	0	1	0
1	1	0	1
1	1	1	0

Truth Table

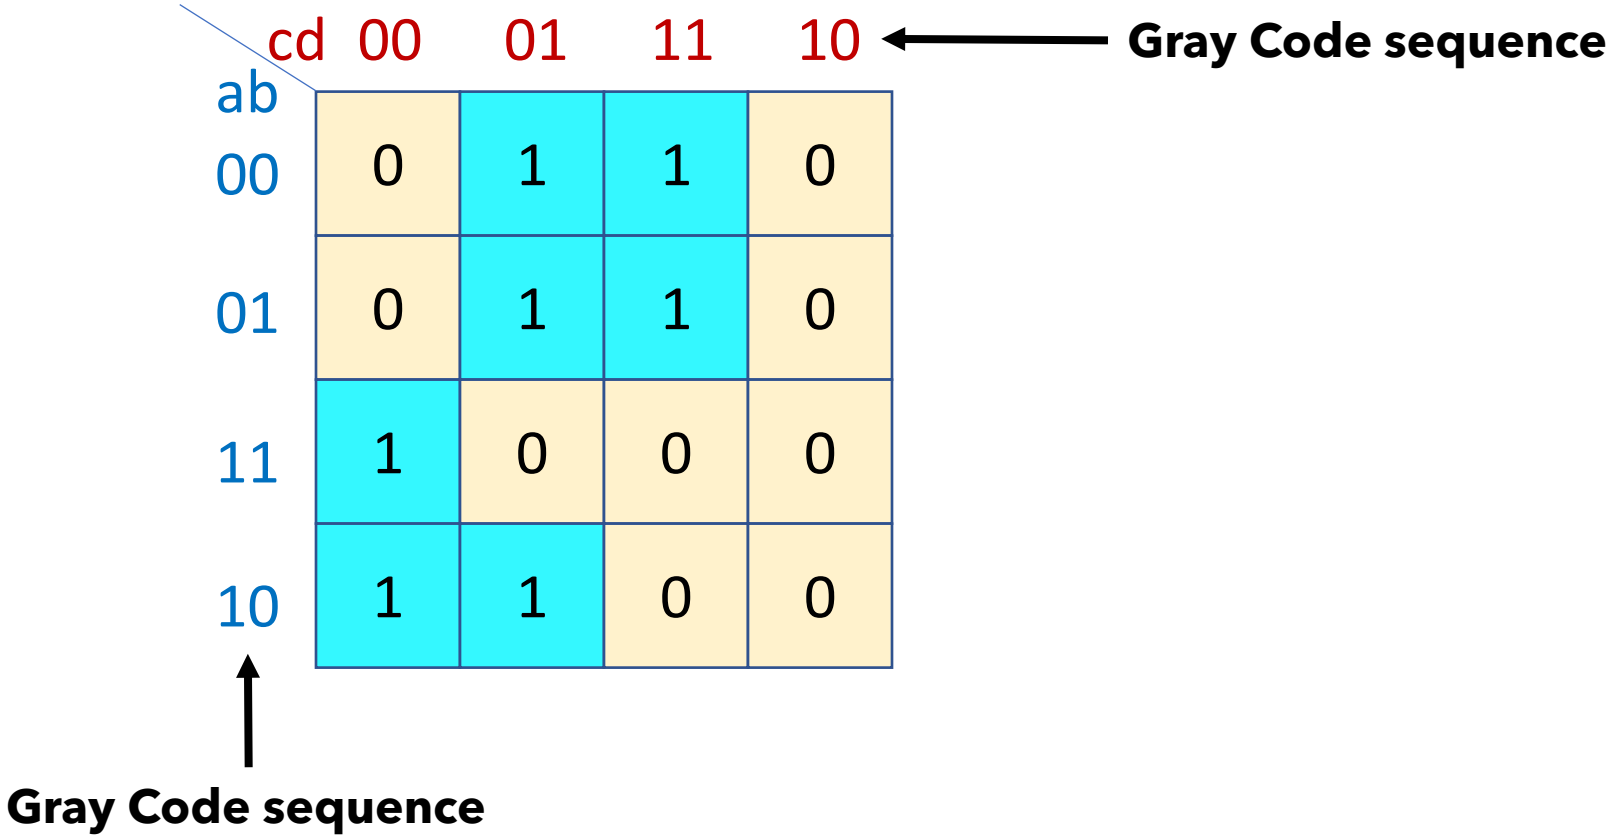


F = a′b′c + a′bc + ab′c′ + abc′

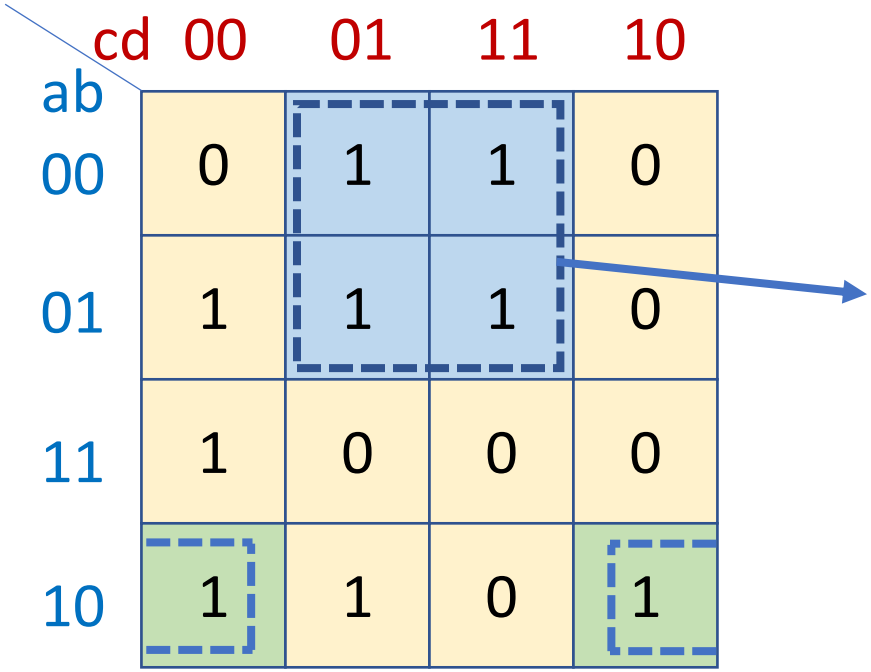


F = $m_1 + m_3 + m_4 + m_6$
= ∑ (1,3,4,6)

4-variable Karnaugh Map



Grouping of cells in K-Map



a'b'c'd + a'b'cd + a'bc'd + a'bcd = a'd

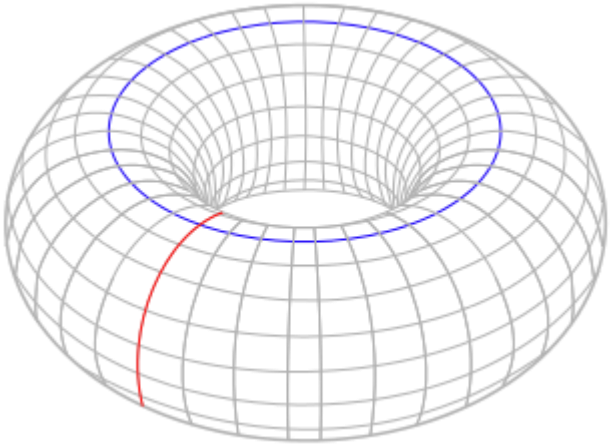
Group represents **term**
Larger group means **smaller term**

Wrapping around

ab \ cd	00	01	11	10
00	0	1	1	0
01	1	1	1	0
11	1	0	0	0
10	1	1	0	1

Grouped cells can wrap around the map border

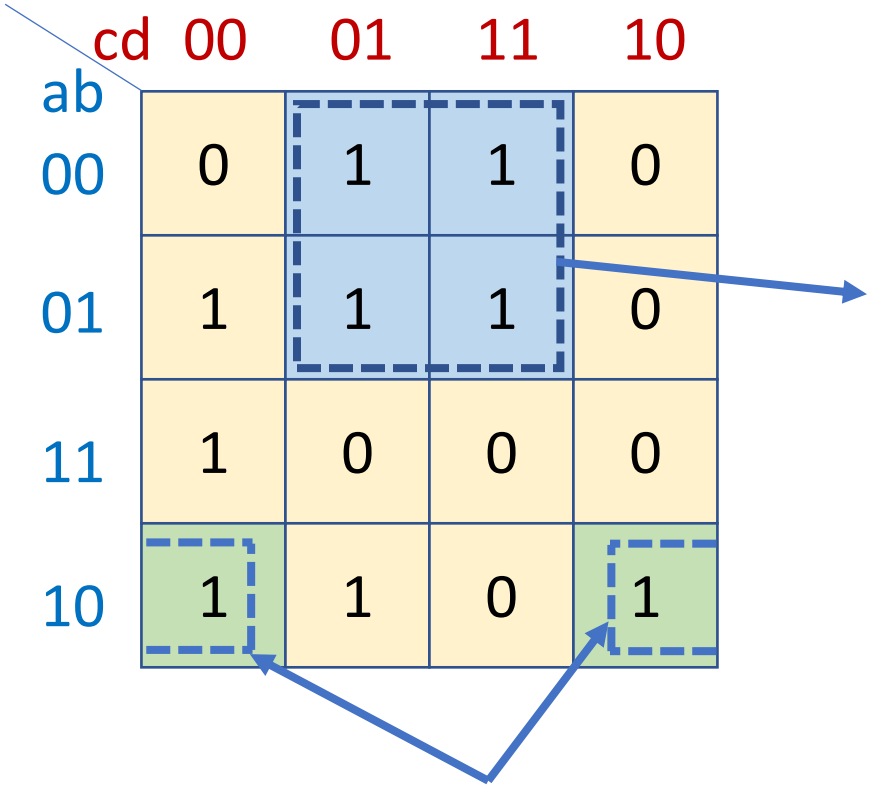
ab'c'd' + ab'cd' = ab'd'



Groups/Regions can wrap around, as in a **Torus**

[Figure Source: Wikimedia https://commons.wikimedia.org/wiki/File:Simple_torus_with_cycles.svg]

Cell grouping: minimizing Boolean expressions



REPLACE: a'b'c'd + a'b'cd + a'bc'd + a'bcd

BY: a'd

Reduces literal count by dropping variables from terms

ab'c'd' + ab'cd' = ab'd'

Deleting redundant groups

Second optimization: dropping terms
